Materials: Characteristics and Comparisons

The quality of sealing is not dependent only of design and construction of doors and windows. It is strongly dependent also of material of the gasket profile.

The most important features of the material for gasket are hardness, elasticity, behaviour on low temperature ambient, resistance against UV radiation and against chemical effects of various paints.

The firm "Gasket" is adopted several high quality materials for production of seals. Their brief descriptions are given herewith.

PVC

is one of the most using material for various sealing profiles for wood doors and windows. The PVC gaskets show good stability against the UV and solar radiation as on the ozone effects, too. But, it is not enough resistant in conditions where elevated temperature and on frequent changes of mechanical loads are present. The greatest preference of PVC gasket is its low price comparing to other materials.

CHEMIGUM

is a mixture of PVC and synthetic rubber that is characterised by low deformability and good resistance against UV radiation. The resistance in elevated temperature conditions is not enough satisfying. The characteristics are better than that of PVC but its price is higher, too. Due to the mentioned reasons it is recommended only for indoor usage.

TPE

is thermoplastic material based on SBS and SEBS. These groups of materials have high resistance against UV radiation and wide temperature range of usage (-30 to +100 °C). It has low deformability during elongation and contraction. Its mechanical characteristics are similar to EPDM. It is wide used for the programme of plastic and aluminium products.

Because of its features, it is recommended for the outdoor and indoor use on PVC and aluminium products.

EPDM

is synthetic rubber sometimes known with commercial name DUTRAK. It is adopted for production treatment with the extrusion. It is characterised by high resistance to UV radiation and by wide temperature range of usage (-30 to +100 °C), in which good characteristics of deformability during elongation and contraction is maintained. The gaskets made of EPDM are provided for the use in PVC and aluminium profiles where they give excellent characteristics important for the best sealing on the openings. Because of this reason, it is recommended for indoor and outdoor use on PVC and aluminium products.
